

# WP3 Biological Samples

Sue Ring

Closer KEW 16<sup>th</sup> January 2013

Avon Longitudinal Study  
of Parents and Children

Supported by  
**wellcome**trust

## WP3

# Harmonisation of strategies for analysing biological samples

- Biosamples
  - Sample collections
  - Data generated from samples
  - Future sample collections
- Cell lines
  - Use of cell line collections

# Biological Samples

urine

hair

umbilical cord

blood

milk teeth

saliva

toe nails

placentas

# USE OF BLOOD SAMPLE

PLASMA

- Biomarkers
- Metabolomics
- Proteomics
- Environmental exposures

White cells

Cell lines

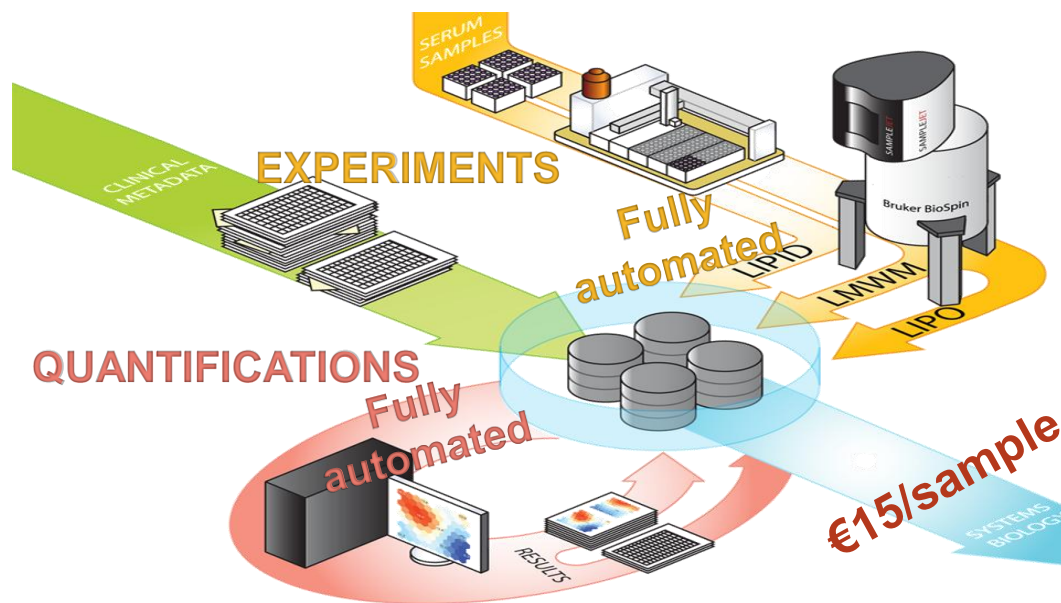

Induced Pluripotent Stem Cells (iPSCs)

DNA  
RNA

- Genetics
- Gene Expression
- Epigenetics

- Cellular assays
- Metabolomics
- Proteomics

# Metabolomics - Mika Ala-Korpela

  
**95,000 samples analysed**  
**(1 spectrometer 3.5 y)**

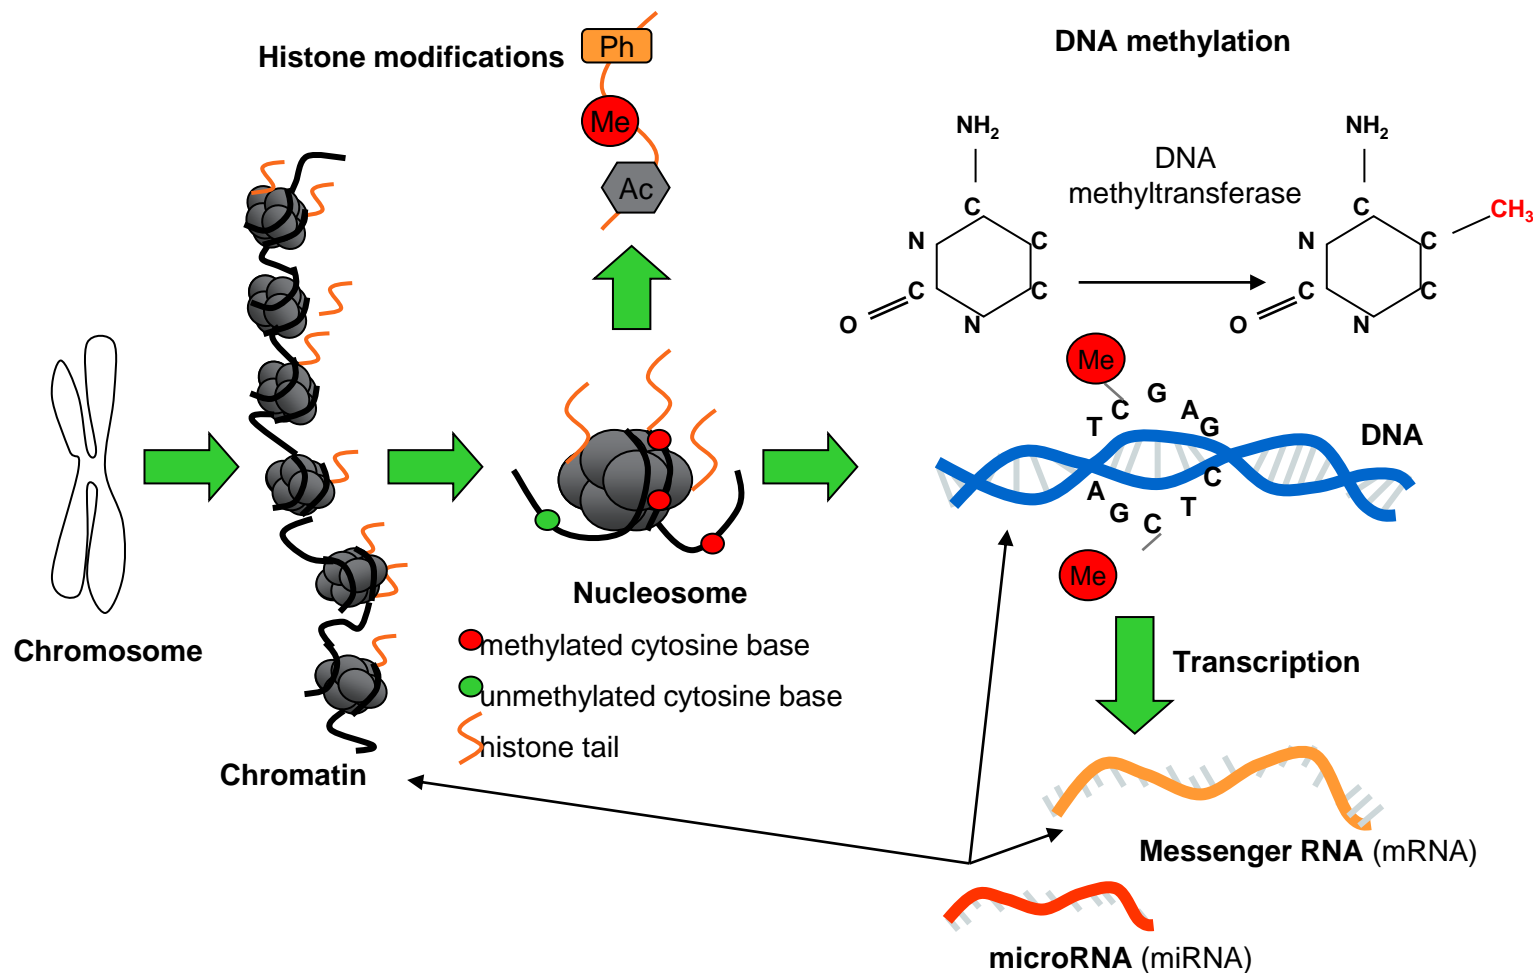

**BBRC 375**, 356, 2008  
**Analyst 134**, 1781, 2009  
**Mol Syst Biol 6**, 441, 2010  
**Nat Genet 43**, 1131, 2011  
**Nat Genet 44**, 269, 2012

# Epigenetics

The heritable changes in gene expression that occur without changes in DNA sequence

# Harmonisation Issues for blood Analysis

- Fasting or non fasting?
- Anticoagulant
  - eg EDTA, heparin, clotted sample ?
- Time from collection to processing
  - immediate or after transport?
- Storage
  - how long? What temperature?

# Harmonisation Issues for Analysis

## eg cotinine

- Can be measured in plasma, saliva, urine, hair
- Various methods, qualitative and quantitative

eg ELISA, HPLC

# Cell line production

Peripheral Blood Lymphocytes (white blood cells) isolated from blood

Add Epstein Barr Virus and put in solution containing sugars, protein and growth factors.

37°C  
for 6 to 8  
weeks

“feed” every  
3 to 4 days

“Transformed” cell line  
which will grow indefinitely  
and provide infinite supply  
of cells and DNA

# Induced pluripotent stem cells

Induced pluripotent stem cells (iPSC) are pluripotent cells derived from reprogramming of non-pluripotent cells such as fibroblast, blood cells and lymphoblastoid cell lines.

Add  
genes or  
treat with  
virus

Differentiation

Nerve cells

Cardiac  
muscle cells

Cartilage

Fat cells

## Initial Aims of WP3

### Existing sample collections

- Is there scope for combined analysis strategies?

### Data generated from samples

- What harmonisation issues can be addressed?

### Future sample collections

- Produce guidelines for harmonising sample collections within constraints of budgets and locations

### Cell lines

- How can we utilise the large cohort cell line resources?

ANY SUGGESTIONS?
