

# Longitudinal Administrative Data and Survey Data linkage: some problems and solutions

Lorraine Dearden  
28<sup>th</sup> January 2016

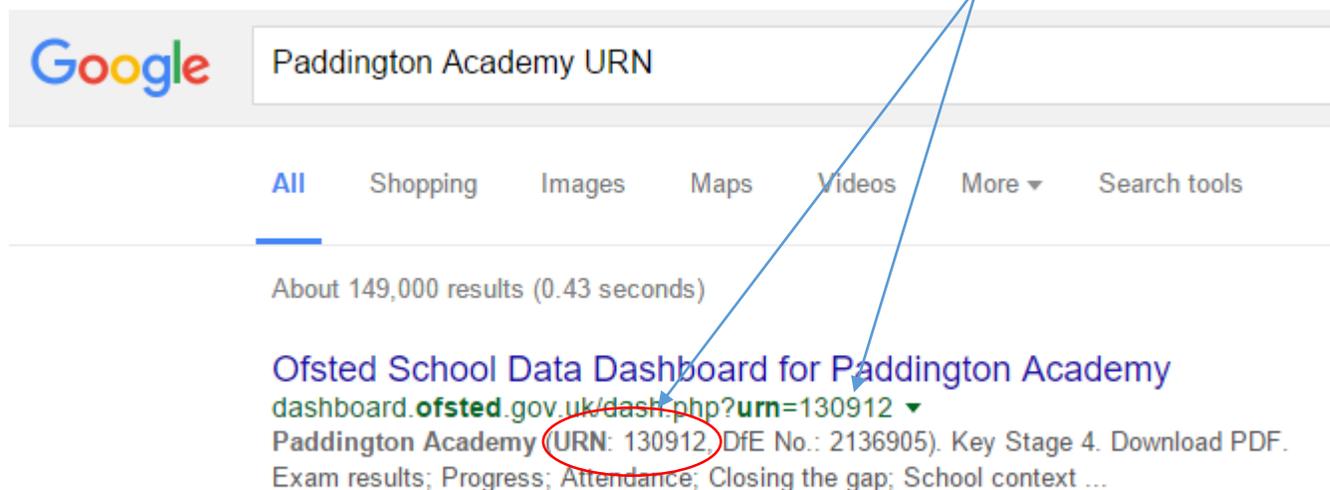

## Key issues

---

- Panel surveys are increasingly obtaining permission to link to administrative data sets
  - Health data e.g. Hospital Episodes Data
  - Crime data held by MoJ
  - Economic data held by DWP/HMRC
  - Education data held by DfE, BIS, HESA, UCAS.....
- So far, it is education data from the National Pupil Database (NPD) which has been most widely linked
  - E.g. to ALSPAC, MCS, Next Steps, Understanding Society

## What is the problem?

- For at least some of these longitudinal panels (e.g. MCS) the school identifier in this administrative data needs to be *anonymised* in order to ensure confidentiality of survey participants
  - The school identifier in the NPD – the unique reference number – URN is a publically available school identifier
- I did a google search for Paddington Academy URN

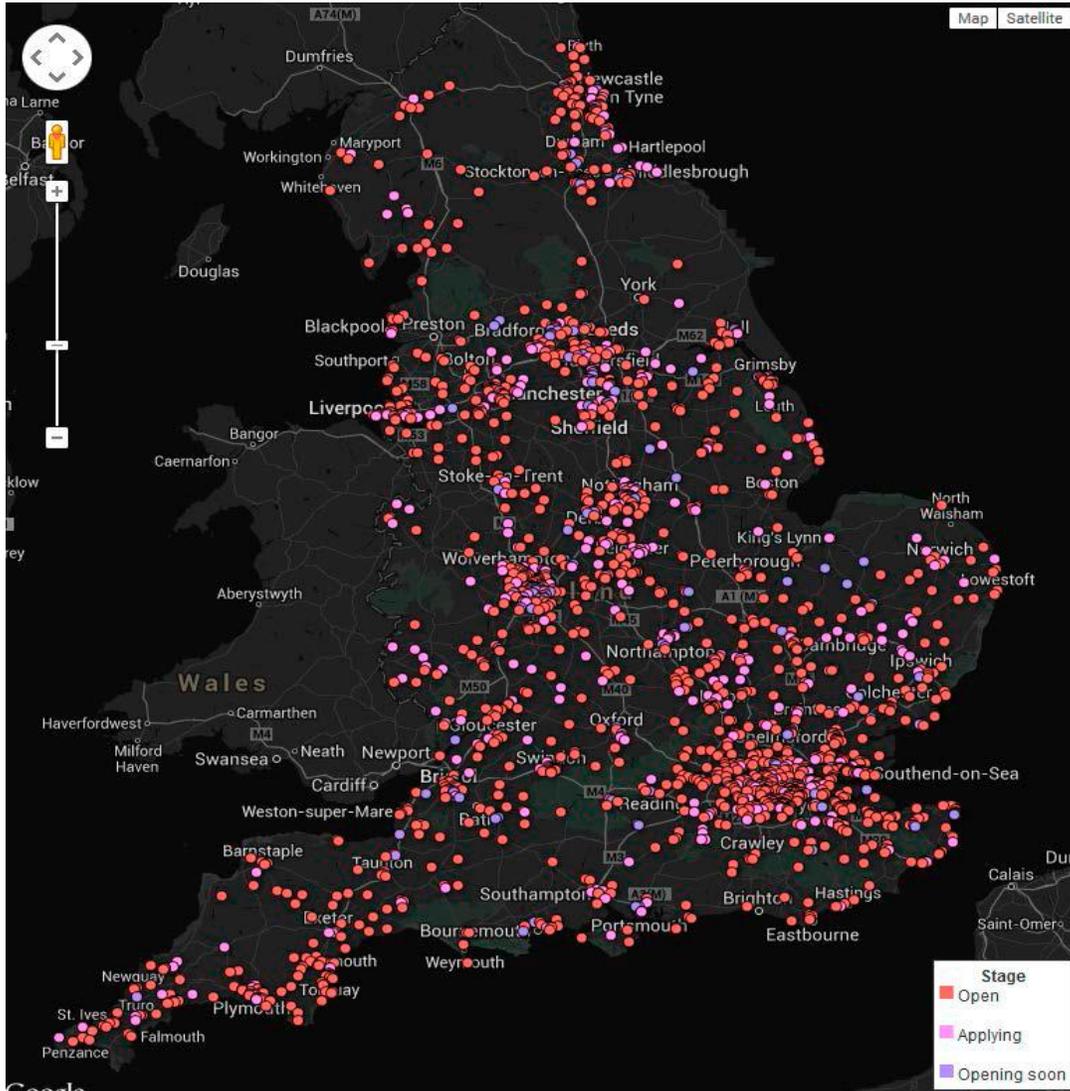

A screenshot of a Google search interface. The search bar contains the text 'Paddington Academy URN'. Below the search bar, there are tabs for 'All', 'Shopping', 'Images', 'Maps', 'Videos', 'More', and 'Search tools'. The 'All' tab is selected. Below the tabs, it says 'About 149,000 results (0.43 seconds)'. The first search result is titled 'Ofsted School Data Dashboard for Paddington Academy' with the URL 'dashboard.ofsted.gov.uk/dash.php?urn=130912'. The text 'URN: 130912' in the result description is circled in red. Two blue arrows point from the text 'I did a google search for Paddington Academy URN' to the search bar and the circled URN.

## But is it unique?

- The name URN suggests this identifier is *unique BUT* they are far from unique
  - Change if school changes status e.g. from comprehensive to academy
  - If schools merge
  - If boundary changes to local authorities occur
  - If the school moves site
  - .....
- This becomes a huge problem if this identifier is anonymised as a researcher no longer knows if a school identifier changes is a real school move or simply a school changing status etc.....

# Changes are large in any one year...

**Motivation:**

**School identifiers (Unique Reference Number – URN) change due to changes in school structure.**

**Changing school identifiers are a problem!**

**Empirical research:**

- **How to construct a consistent panel of schools?**
- **How to adequately control for school-level prior attainment?**
- **How to control for school level clustering appropriately?**

**Education charities:**

- **How to maintain list of eligible schools?**
- **How to track attainment of schools involved in program?**

The Problem: Example

Merge LEASIS 2012 with LEASIS 2013 schools data...

_merge	Freq.	Percent	Cum.
master only (1)	1,253	4.90	4.90
using only (2)	1,236	4.83	9.73
matched (3)	23,092	90.27	100.00
Total	25,581	100.00	

Some URNs only in 2012

Some URNs only in 2013

But only one unmatched school from 2012 actually closes between 2012 and 2013.

**The Problem: Example**

**What is the impact of changing to academy on KS2 (age 11) Average Points Scores?**

	Ignore changing URNs	Account for changing URNs
Change to academy between 2010/2011 and 2011/2012	1.054***	0.782***
Standard error	[0.190]	[0.190]
N (schools)	14,413	14,879

Note: OLS regression also accounts for prior APS (2010/2011) and interaction between prior APS and change to academy status.

**Solution – Database of Schools to merge school identifiers in adjacent years creating a consistent panel of schools:**

- We have created a file which links schools between 1994 and 2014
- Will be updated to include 2015 data in next month
- Will be made publicly available (dataset and syntax)
  - Currently talking to DfE about how we can make this publically available

## Solution – Database of Schools:

### 1. Make LEASIS\* files consistent over time:

- Create phase of education variable based on number of pupils of each age.
- Make school type consistent over time (academy, maintained, college etc)
- Clean school names (e.g. change “Roman Catholic” to “rc”)
- Add postcode from EduBase

\*Note: LEASIS files are data for all school in England (including private schools) that Have been produced since 1994 with. Stopped being produced in 2015.

- Contain pupil numbers by age/gender, %FSM, Pupil Teacher Ratio, %SEN, Ethnicity etc....
- Can be linked to school results files at KS1, KS2, KS4 and KS5

## Solution – Database of Schools:

### 1. Make LEASIS files consistent over time

### 2. Link schools across years, for each year:

- Merge using URN
- If no link created, merge using LA and ESTAB
- If no link created, merge using postcode and clean school name
- If no link created, merge using postcode and phase of education
- If no link created, merge using postcode and ESTAB
- If no link created, merge using DfE individual level census data (if available)

## Solution – Database of Schools:

1. **Make LEASIS files consistent over time**
2. **Link schools across years, for each year**
3. **Link backwards and forwards over time:**
  - Schools that convert have two rows
  - Schools that merge have multiple rows
  - Links can be traced whatever year the researcher starts from

## Solution – Database of Schools:

1. **Make LEASIS files consistent over time**
  2. **Link schools across years, for each year**
  3. **Link backwards and forwards over time**
- **Database provides information on school mergers, closures, opening and changes in school status.**

One for one change: North Westminster Community School became Paddington Academy

# Schools Database and Data linkage

## Database of Schools: Linkage to Surveys

- In principle, any survey capturing school age children post-1993 can be matched to database of schools
  - ALSPAC (1990/1991)
  - BHPS/Understanding Society (1991/2009)
  - MCS (2000/2001)
  - LSYPE (2004).
- Most Importantly we can show from our database, we can say why an individuals school identifier changed before anonymisation in panel survey data
  - Extra variable in survey data:
    - Real school change; change of status of school (and what that change was) school merger; school closure etc – really important for getting analysis right
    - E.g. in MCS can have anonymised school identifier for each year of school and if this changes for individual can say why this change occurred
    - At moment this has NOT been done in MCS (or other surveys)

## Conclusions

- Linkage to surveys carried out by data holders
- Data holders generally provide pseudonymised school identifiers – which are consistent over time
- But reasons for changes in identifiers cannot be established once pseudonymised – means longitudinal analysis using education data could be wrong – no problems for cross-sectional work
- Guidelines and approach are currently being established how we grant access to this resource....
- Applications are wider than for education data – similar problems with changes in hospitals, prisons, .....
